

JAYTRIX SYSTEMS

SERVICE & BUSINESS DEVELOPMENT HANDBOOK

Understanding Our Technology Services, Client Problems, Sales Process & Business Development

Technology Solutions | Business Growth | Client Acquisition

TECHNOLOGY | INNOVATION | EXCELLENCE

Internal training guide for Business Development and Client Acquisition
Illustrative examples are fictional and are not claims about JAYTRIX clients.

Brand palette: Navy blue | Charcoal | White

Welcome & how to use this handbook

This guide is for a new JAYTRIX SYSTEMS representative with a business background and little or no technical experience. It explains services through client needs. You do not need to code. You do need to listen, ask clear questions, record facts, and bring the technical team into decisions about scope, price, security and timing.

Contents

01 Introduction and service map

02-17 Service guides: websites, commerce, systems, apps, infrastructure, security

18 Discovery | 19 Qualification | 20 Client acquisition | 21 First approach

22 Communication | 23 Objections | 24 Sales process | 25 Technical handover

26-33 Case studies | 34 Weekly workflow | 35 Lead tracking

36 Professional rules and role | 37 Collaboration model and quick references

38 Final sales playbook

JAYTRIX SYSTEMS | SERVICE & BUSINESS DEVELOPMENT HANDBOOK

01 | Introduction: what JAYTRIX does

JAYTRIX SYSTEMS is a Tanzania-based technology solutions company. It helps businesses and organizations improve operations, customer experience, efficiency, information management and growth through appropriate technology services.

Our work starts with understanding the business problem. The right answer may be a website, a system, advice, an integration, security work, or no new software yet. We do not sell technology for its own sake. We connect a real need to a suitable solution, then confirm feasibility, scope, cost and timing with the technical team.

BUSINESS PROBLEM > UNDERSTAND THE NEED > DESIGN A SOLUTION > BUILD / IMPLEMENT
> DEPLOY > SUPPORT > BUSINESS VALUE

Selling software means describing features. Selling a solution means understanding the client's work, explaining how a suitable service could help, and agreeing what will be delivered. Benefits depend on the client's situation and implementation.

Service map: online presence and sales (websites, e-commerce); daily operations (management, school, POS, stock, booking, automation); access on devices (mobile, desktop); connections and foundations (backend/API, integration, hosting, IT advice); protection (cybersecurity); tailored work (custom technology).

02 | Business Websites

A website is a set of online pages that explains an organization and helps people contact it.

It can build a clear online presence and answer common questions.

Need: customers rely only on scattered social posts or repeated WhatsApp explanations. Users: companies, schools, hotels, restaurants, professionals, NGOs.

Example: a fictional Arusha hotel lists rooms, location, services, gallery and inquiry contacts so guests can review details before messaging.

JAYTRIX may provide home/about/services or products/contact/location pages, forms, WhatsApp/social links, gallery, news and content management where required.

Benefits: clearer information, easier inquiries, better customer experience and an owned place to present the organization. Results depend on content and promotion.

Signals: no website, outdated details, hard-to-find contacts, repeated questions. Ask: Who visits? What should they do? What content changes? Need forms, map, WhatsApp, languages? Who approves copy? Deadline?

Say: We can organize your key information online and make it easier for customers to understand your services and contact you. May I ask how people find you now?

Do not promise rankings, traffic, leads, copywriting, hosting, delivery date or features before scope is confirmed.

Conversation: Rep: How do guests learn about rooms and location? Hotel: They ask us on WhatsApp. Rep: A website could present those details and direct guests to your preferred inquiry channel. Which information changes often? Rep: I will record the need and ask our team to confirm scope and cost.

03 | E-commerce Websites

E-commerce lets customers browse products and place orders online. Unlike an information website, it supports a buying process.

Need: orders are hard to track across calls and messages. Users: retailers, fashion, electronics, cosmetics, food, wholesalers and online sellers.

Example: a fictional Dar es Salaam clothing shop lists sizes and prices and records orders for staff to confirm delivery.

Possible parts: catalogue, cart, checkout, customer accounts, orders, payment option, delivery steps, admin dashboard and stock connection if agreed.

Benefits: more convenient ordering, organized orders, wider sales opportunities and clearer order records.

Signals: many product inquiries, repeated price checks, manual order errors. Ask: How many products? Who updates prices? How are orders confirmed? Which payment methods? Delivery areas? Returns? Stock rules?

Say: We can explore a store that presents products and organizes online orders around how you handle payment and delivery.

Do not promise payment provider approval, automatic delivery, fraud prevention, sales growth or stock sync until confirmed.

04 | Custom Business Management Systems

A business system keeps important work and records in one organized place, based on the client's process.

Need: notebooks, disconnected sheets or separate tools make it hard to see customers, sales, staff, payments, orders or branches. Users: SMEs, distributors, service firms and multi-branch organizations.

Example: a fictional Mwanza supplier records customers, orders and payments in separate books and wants one controlled view.

Possible parts: customer, sales, stock, staff, reports, payment records, orders, branches and user permissions, selected after discovery.

Benefits: less repeated entry, more consistent records, easier reporting and clearer responsibility.

Signals: repeated reconciliation, missing records, different totals. Ask: Which process first?

Who uses records? What reports? How many branches? What tools? Who can see/edit? What must be retained?

Say: We first map your current process, then assess whether one tailored system can bring the essential records together.

Do not promise every process, migration, integrations, automation or fixed price without technical scoping.

05 | School Management Systems

A school system organizes selected student and school administration records.

Need: student details, fees, attendance, exams, teacher information, parent communication and reports are spread across files or books. Users: schools, colleges and training centers.

Example: a fictional secondary school wants administrators to find fee and attendance records without searching several registers.

Possible parts: student records, fees, attendance, examinations, teacher roles, parent communication and reports, based on school policy.

Benefits: easier record access, fewer repetitive searches, more organized communication and reporting.

Signals: term-end reporting takes effort; parents wait for information. Ask: How many students/campuses? Which records? Fee rules? Attendance process? Who needs access? What reports? Internet constraints? Data migration?

Say: We can discuss a system organized around your student and administrative workflows. Which task takes staff the most time?

Do not promise compliance, automatic payment reconciliation, parent app, migration or a school-calendar deadline without confirmation.

06 | Restaurant / POS Systems

POS means point of sale: the place or system where a sale is recorded. A restaurant POS can organize orders, tables and payments.

Need: handwritten orders, slow bill preparation, unclear sales totals or stock usage. Users: restaurants, cafes, hotels and food outlets.

Example: a fictional Dodoma cafe wants staff to send table orders consistently and review daily sales.

Possible parts: menu, tables, orders, receipts, user access, sales reports, payment records and stock links when agreed.

Benefits: more organized order handling, clearer sales records and easier review of busy periods.

Signals: lost tickets, billing disputes, slow checkout. Ask: How many outlets/tables?

Dine-in/takeaway? How are orders sent? Receipts? Payment types? Internet reliability? Existing stock tools?

Say: A POS can help record orders and sales in one workflow. Let us understand your service style before suggesting features.

Do not promise hardware compatibility, offline behavior, tax integrations, payment processing or exact speed without technical review.

07 | Inventory & Sales Systems

Inventory means the goods a business keeps for sale or use. A stock and sales system records products, purchases and movements.

Need: owners cannot see what is available, sold, received or low. Users: shops, pharmacies, wholesalers, hardware stores and distributors.

Example: a fictional Morogoro shop compares shelf stock with notebook totals and wants clearer movement records.

Possible parts: products, purchases, sales, stock adjustments, low-stock notices and reports.

Benefits: better stock visibility, more consistent records and informed reordering.

Signals: frequent stockouts, unexplained differences, manual counts. Ask: How many products/locations? Units? Who receives goods? Returns? Reordering rules? Sales channels?

Current records?

Say: We can explore a simple way to record stock coming in and going out, then agree what reports matter.

Do not promise perfect stock accuracy, barcode hardware, accounting or automatic supplier links before confirming process and scope.

08 | Booking & Appointment Systems

A booking system records requested times or services and helps staff manage availability.

Need: double bookings, missed messages or no shared view of appointments. Users: salons, hotels, clinics, consultants, training centers and repair services.

Example: a fictional salon in Dar es Salaam wants clients to request a stylist and time without repeated calls.

Possible parts: services, staff availability, booking form, confirmations/reminders, cancellation rules and staff view.

Benefits: organized schedules, easier customer requests and fewer manual checks.

Signals: appointment conflicts, busy phone line. Ask: What is booked? Duration?

Staff/resources? Opening hours? Deposits? Changes/cancellations? Reminders?

Say: We can map how customers request time today and see whether an online booking flow fits your rules.

Do not promise calendar integrations, SMS cost, reminders or availability logic until confirmed.

09 | Mobile Applications

A mobile app is software people use on a phone or tablet. It may serve customers or staff.

Need: users need a focused phone experience, location features or frequent access beyond a browser. Users: delivery, marketplaces, booking services and field teams.

Example: a fictional local delivery firm wants riders to view assigned jobs and update progress.

Possible parts: customer/staff screens, account access, notifications and connection to business records, depending on discovery.

Benefits: convenient access and a focused service journey when an app is justified.

Signals: repeated phone workflows, app requested by customers. Ask: Who uses it? What task? Why not a website? Android, iPhone or both? Connectivity? Existing system? Who supports content?

Say: We first test the user need and compare an app with a mobile-friendly website before recommending either.

Do not promise app-store approval, downloads, device support, offline features or launch dates without technical confirmation.

10 | Desktop Applications

Desktop software runs on a computer, often for staff operations or specialized work.

Need: a work area needs a focused computer interface, local equipment connection or planned offline workflow. Users: offices, retail counters, workshops and operations teams.

Example: a fictional workshop needs a counter application for service records where internet availability is uneven.

Possible parts: staff screens, records, reports and agreed device or offline behavior.

Benefits: tailored workplace workflow and clear task handling. Limits: installation, updates, device coverage and shared data need planning.

Signals: work happens at a fixed counter; browser flow is unsuitable. Ask: Which computers? Internet reliability? Multiple locations? Shared records? Devices/printers? Who installs and updates?

Say: A desktop option may fit some staff workflows; our team needs to review devices and connectivity first.

Do not promise offline sync, printer support, Windows compatibility or maintenance until confirmed.

11 | Backend & API Development

Backend: the part of software that handles business rules, data and communication behind the screens. API: a way for software systems to communicate.

Need: a website or app needs a reliable place for shared records or must exchange information with another service. Users: firms building apps, platforms or integrations.

Example: a fictional booking app needs a shared service to save bookings and return availability.

Possible parts: data handling, access rules, agreed connections and documentation for other software.

Benefits: consistent information behind multiple screens and reduced duplicate handling when integrations work as agreed.

Signals: customer mentions app-server connection, payment/SMS link or an existing platform.

Ask: Which systems? What information moves? Who owns them? Is documentation available? What happens on errors?

Say: This is the behind-the-scenes connection that lets an app manage information or communicate with another service.

Do not promise access to third-party systems, API availability, government connectivity or integration cost without review.

12 | System Integration

Integration means connecting separate systems so agreed information can move between them.

Need: staff copy the same order or customer data into multiple tools. Users: retailers, online sellers, service firms and organizations with existing platforms.

Example: a fictional online seller wants approved orders to appear in its stock records.

Possible parts: process mapping, agreed data exchange, error handling and monitoring arrangements.

Benefits: less duplicate entry, smoother handoffs and more consistent records when the systems support the connection.

Signals: repeated copying, mismatched records, disconnected payment/order tools. Ask: Which systems? Who supplies access? What fields move? How often? What is source of truth?

Say: We can assess whether your tools can share the information you need and what a safe connection would involve.

Do not promise that any two systems can connect, or guarantee third-party uptime or data accuracy.

13 | Hosting & Website Maintenance

A domain is the site's name. Hosting is the rented online space/computing service where it runs. SSL helps encrypt a visitor's connection; HTTPS shows a protected connection. Deployment means publishing an update.

Need: a website needs to stay reachable, updated and recoverable. Users: any organization with an online service.

Example: a fictional NGO wants someone responsible for backups and routine site updates after launch.

Possible parts: domain/DNS coordination, hosting setup, SSL configuration, backups, updates, monitoring and maintenance agreed by plan.

Benefits: clearer ownership, planned upkeep and faster discovery of certain issues. Ongoing support is commonly recurring work.

Signals: expired domain, broken forms, no known backups. Ask: Who owns domain? Where hosted? Admin access? Backup history? Update frequency? Support hours?

Say: We can review how your website is hosted and maintained, then define ongoing responsibilities.

Do not promise 100% uptime, instant recovery, ownership transfer, security or fixed recurring cost without scope.

14 | IT Consultancy

IT consultancy is practical advice about technology choices, current systems and work processes.

Need: client knows the problem but is unsure what solution to choose. Users: SMEs, NGOs, schools and growing teams.

Example: a fictional service company wants to reduce duplicate customer entry but is unsure whether it needs new software.

Possible parts: discovery, review of current workflow, options, priorities and recommendations.

Benefits: clearer decisions and reduced risk of buying a tool that does not fit.

Signals: conflicting vendor advice; unclear requirements. Ask: What outcome? What tools? What is failing? Who is affected? What constraints?

Say: We can start by understanding the problem before recommending a product or build.

Do not promise savings, a diagnosis or a fixed implementation plan before assessment.

15 | Cybersecurity Solutions

Cybersecurity protects systems and business information from unauthorized access, loss or disruption.

Need: weak passwords, broad access, missing backups or poor server setup can expose data and interrupt work. Every connected organization may need sensible protection.

Example: a fictional accounting office wants staff access reviewed and backup practices understood.

Possible parts: access and configuration review, password practices, backup planning, HTTPS checks, monitoring options and written recommendations.

Benefits: better awareness, stronger routine controls and clearer recovery planning. No service guarantees zero risk.

Signals: shared accounts, former staff still active, no tested backups. Ask: Who accesses data? How removed? Backups? Sensitive records? Existing controls?

Say: We can discuss a defensive review to identify practical security improvements.

Do not claim certification, guaranteed protection or perform tests without written scope and authorization.

16 | Business Process Automation

Automation uses a system to handle agreed repeated steps with less manual effort.

Need: staff repeatedly copy information, send routine notices or prepare the same report.

Users: offices, schools, sales teams and service businesses.

Example: a fictional training center receives registrations, re-enters details and builds attendance lists manually.

Possible parts: form capture, record creation, notifications and reports after workflow review.

Before: form > manual copying > message > report. After: form > stored record > agreed workflow > available report.

Benefits: reduced repetitive work and more consistent handling. Humans still need to review exceptions.

Signals: repeat work, delays, avoidable entry errors. Ask: What starts the task? Steps?

Exceptions? Approver? Current tools?

Say: We can map the repeated task and see which steps can safely be automated.

Do not promise complete automation, error elimination or integration before a process assessment.

17 | Custom Technology Solutions

A custom solution is planned around a particular business need when existing options do not fit well enough.

Need: several connected problems do not match a single standard service. Users: organizations with specific workflows or service models.

Example: a fictional regional cooperative needs member, collection and reporting workflows assessed together.

Possible parts: discovery, options, scoped software, integrations or IT services depending on confirmed needs.

Benefits: closer fit to work; may require more planning and ongoing support than a ready-made tool.

Signals: repeated workarounds; multiple systems with gaps. Ask: What outcome? What has been tried? Must-haves? Users? Constraints?

Say: We can document the need and compare practical options, including whether custom work is justified.

Do not promise feasibility, price, timeline or feature completeness without technical scoping.

18 | Identify a client problem: discovery

Listen before selling. Let the client describe work in their own words. Ask one question at a time; do not assume that a tool is the answer. Confirm what you heard.

Useful questions

What process is currently difficult for you? How do you manage records today?

Are notebooks or spreadsheets involved? How do customers place orders?

How do you track sales and generate reports? What takes staff most time?

What information is difficult to access? Which tasks repeat? What happens when something goes wrong? Who uses the process? What would a better outcome look like?

Reflect back: So orders arrive through several channels, and the team combines them manually each evening. Have I understood correctly? Ask permission before suggesting a next step. Record facts, current tools, people affected, constraints and unknowns.

Avoid: interrupting, technical jargon, criticizing existing staff or declaring a solution before understanding the workflow.

19 | Qualify the opportunity

Qualification helps decide what next action is useful; it is not a test of the client.

Checklist: NEED - What business problem and desired outcome? DECISION MAKER - Who approves? BUDGET - Is a budget range planned? TIMELINE - What event or date matters? CURRENT PROCESS - How is work done now? URGENCY - Why act now? SCOPE - Which users, locations and tasks? ABILITY - Can the client provide access, content and decisions?

☐ Need is clear ☐ Stakeholders known ☐ Current process recorded
☐ Timing discussed ☐ Budget approach discussed ☐ Next step agreed

If details are unknown, mark them unknown. Do not label a lead unqualified solely because the first conversation did not cover budget. Agree a next discovery step.

20 | Client acquisition methods

NETWORKING - meet local business groups; target owners and managers. Opener: What process are you trying to improve this quarter?

REFERRALS - ask a satisfied contact to introduce an appropriate business. Opener: Would you be comfortable introducing me to the person responsible for operations?

WHATSAPP - use permission-based, personal messages; target known businesses. Opener: May I ask how you currently handle appointment requests?

SOCIAL MEDIA - comment usefully, then message only when relevant. Opener: I noticed you take orders in comments; how do you keep each order organized?

LINKEDIN - connect with operations, school, retail or business leaders. Opener:

I work with JAYTRIX SYSTEMS and would value learning how your team manages [process].

DIRECT OUTREACH - research before contacting. BUSINESS VISITS - ask for the right person and respect busy hours. PARTNERSHIPS - explore referrals with agencies or business advisers. EXISTING CONTACTS - reconnect with a relevant question.

DIGITAL MARKETING - share useful service explanations; invite discovery, do not claim guaranteed results. Tailor each message, identify yourself and make an easy opt-out.

21 | Approach a client professionally

Weak: Hello, we make websites. Do you need one?

Better: Hello, I work with JAYTRIX SYSTEMS. We help businesses improve operations through websites and custom technology solutions. I was looking at your business and wanted to understand how you currently manage [specific process].

Why it works: it is relevant, respectful, focused on their work and invites a conversation instead of pushing a product. Personalize only with information you can verify. Introduce yourself and JAYTRIX honestly. Ask whether now is a good time.

After the conversation, send a brief summary: what you heard, what remains unclear, and the agreed next step/date. Do not send confidential information to others without permission.

22 | Communication and persuasion

Confidence means speaking clearly, not pretending to know everything. Listening means giving the client time and checking you understood. Explain value in the client's terms: less repeated entry, easier access, clearer reports or simpler contact.

Build trust: be punctual, transparent, accurate and consistent. Admit uncertainty: I want to confirm that with our technical team before I answer. Never use fear or misleading urgency. Persuasion should connect a real client problem to a suitable option. Follow up at an agreed time and respect a request to stop.

23 | Common objections

WE DON'T NEED A WEBSITE. Meaning: no visible need or prior disappointment. Reply: Understood. How do customers find accurate information today? Stop if no need.

TOO EXPENSIVE. Meaning: budget mismatch or value unclear. Reply: Which part of the scope is most important? Ask technical team before changing scope or price.

WE USE EXCEL. Meaning: current tool may work. Reply: What becomes difficult as records grow? Do not dismiss Excel.

WE ARE SMALL. Meaning: worry about cost/complexity. Reply: Which one task would make the biggest difference? Team confirms an appropriately small scope.

WE NEED TO THINK. Reply: Certainly. What information would help your decision?

REDUCE THE PRICE? Reply: I can record the budget and priorities for review; I cannot approve discounts. HOW LONG? Reply: We need the confirmed scope before a reliable timeline.

CAN YOU BUILD THIS? Reply: I will capture how it should work and ask the technical team to confirm feasibility, effort and dependencies.

24 | Sales process and representative duties

LEAD - identify and record a relevant organization. FIRST CONTACT - introduce yourself, personalize and seek permission. DISCOVERY - listen and document the process. QUALIFICATION - understand need, stakeholders, budget approach, timing and readiness. SOLUTION - map the need to a possible service, subject to review. PRESENTATION - explain confirmed scope and value simply. PROPOSAL - coordinate an approved written scope, price and assumptions. NEGOTIATION - record changes; get approval for price/scope decisions. AGREEMENT - ensure authorized terms are accepted. DEPOSIT/PAYMENT - follow the approved company process; never collect informally. DEVELOPMENT - maintain communication and route new requests. DELIVERY - coordinate handover/acceptance with the team. SUPPORT - explain agreed support route and keep relationship alive.

At every stage: record owner, status, next action, date and client expectations.

25 | Working with the technical team

Bring the technical team in for complex requirements, architecture, integrations, pricing by scope, security, hosting, unusual features, data migration, device needs and timelines. Include the client's business goal, current process, users, examples, constraints, must-haves and open questions. Do not forward passwords or sensitive records casually.

Technical team confirms feasibility, scope, delivery approach, dependencies, price and timeline. Representative owns the relationship, accurate notes, business value and follow-up.

DO NOT PROMISE WHAT YOU HAVE NOT CONFIRMED.

Never promise a feature, delivery date, discount, result, certification, integration, security outcome or support level without authorized confirmation.

26-33 | Illustrative case study 1: Restaurant

These scenarios are fictional training examples, not claimed JAYTRIX clients.

Situation: a fictional Dar es Salaam restaurant takes orders on paper

Problem: tickets and end-of-day totals are hard to reconcile

Ask: Where do orders start? How many tables? What payment records? Possible POS discovery

Benefit: organized order and sales records

Approach: ask about order handoff, not software first

Handover: sample menu, users, outlets, payment steps, connectivity, reports.

26-33 | Illustrative case study 2: School

These scenarios are fictional training examples, not claimed JAYTRIX clients.

Situation: a fictional Arusha school keeps attendance and fee details in separate registers

Problem: staff spend time finding records

Ask: Which reports? Who updates fees? What access is needed? Possible school system review

Benefit: organized records and easier retrieval

Handover: roles, processes, data volume, term cycle, connectivity, privacy needs.

26-33 | Illustrative case study 3: Salon

These scenarios are fictional training examples, not claimed JAYTRIX clients.

Situation: a fictional Mwanza salon books by calls and messages

Problem: overlapping appointments

Ask: staff, services, duration, cancellations? Possible booking workflow

Benefit: clearer schedule

Handover: availability rules, staff, reminders, deposits, exceptions.

26-33 | Illustrative case study 4: Retail shop

These scenarios are fictional training examples, not claimed JAYTRIX clients.

Situation: a fictional Dodoma shop tracks goods in a notebook

Problem: owners cannot see stock movement quickly

Ask: products, branches, purchase process, stocktake? Possible inventory/sales system

Benefit: more consistent records

Handover: product samples, units, users, sales channels, reports.

26-33 | Illustrative case study 5: Hotel

These scenarios are fictional training examples, not claimed JAYTRIX clients.

Situation: a fictional Zanzibar guesthouse answers repeated room questions by message

Problem: visitors lack one clear information source

Ask: rooms, seasonal content, inquiry route, languages? Possible website and booking discovery

Benefit: organized information

Handover: approved content, photos, contact route, booking rules, domain ownership.

26-33 | Illustrative case study 6: Real estate

These scenarios are fictional training examples, not claimed JAYTRIX clients.

Situation: a fictional Dar property office tracks enquiries and viewing times in separate chats

Problem: follow-up ownership is unclear

Ask: agents, listing fields, viewing process, privacy? Possible customer workflow/booking assessment

Benefit: clearer follow-up

Handover: stages, roles, information access, existing tools, reporting.

26-33 | Illustrative case study 7: Professional services

These scenarios are fictional training examples, not claimed JAYTRIX clients.

Situation: a fictional accounting firm receives client documents through several channels

Problem: requests and status are difficult to track

Ask: request types, approvals, confidentiality, reminders? Possible workflow system or automation assessment

Benefit: more organized requests

Handover: data sensitivity, access roles, exceptions, retention, integrations.

26-33 | Illustrative case study 8: NGO

These scenarios are fictional training examples, not claimed JAYTRIX clients.

Situation: a fictional regional NGO compiles activity reports from field teams

Problem: repeated manual consolidation

Ask: forms, offline areas, indicators, approval process? Possible mobile/data workflow discovery

Benefit: more consistent collection and reporting

Handover: field connectivity, roles, data policy, reporting formats, existing systems.

34 | Daily and weekly workflow

Example daily routine: research relevant prospects; contact them respectfully; hold discovery conversations; record leads and next actions; follow up when agreed; schedule meetings; send qualified opportunities to the technical team.

Example weekly review: prospects contacted, conversations started, qualified leads, presentations, proposals, projects closed and follow-ups pending. These are tracking measures, not company quotas. Agree targets with management; do not invent them.

Review: What did clients ask? Which message opened a useful conversation? What needs technical clarification? What must be followed up next week?

35 | Lead tracking template

CLIENT | BUSINESS | INDUSTRY | CONTACT | PROBLEM | POSSIBLE SOLUTION
LEAD SOURCE | STATUS | NEXT FOLLOW-UP | NOTES | OWNER

Example blank record

Client: organization/person. Business: name. Industry: type of work.
Contact: authorized contact details. Problem: client's words where possible.
Possible solution: early idea, not approved scope. Lead source: referral, visit, etc.
Status: current sales stage. Next follow-up: action/date agreed. Notes: constraints
and open questions. Owner: person responsible. Store records securely; share only with
authorized colleagues.

36 | Professional rules and the role

Protect client information. Do not misrepresent JAYTRIX capabilities or claim a fictional example is a real client. Do not promise technical features without confirmation. Do not give unauthorized discounts. Keep communication professional. Document important conversations and follow up consistently. Respect confidentiality. Escalate technical questions. Never guarantee results that cannot be guaranteed.

POSITION: Business Development & Client Acquisition Representative

RESPONSIBILITIES: find prospects; build relationships; identify business problems; present relevant services; generate qualified leads; coordinate with technical team; follow up; maintain relationships; support project acquisition.

NOT RESPONSIBLE FOR: programming, architecture, implementation, technical guarantees or approving scope without the technical team.

37 | Commission and collaboration model

Proposed model: a representative may receive 40% of PROFIT from a project attributable to a client they successfully introduced, subject to agreed company rules.

CLIENT PAYMENT - amount paid by the client. PROJECT COSTS - agreed direct costs of delivering the project. PROFIT - the amount remaining under the agreed calculation.

COMMISSION - representative's agreed share of that profit.

Example only: Client payment TSh 1,000,000; project costs TSh 300,000; profit TSh 700,000; 40% of profit = TSh 280,000.

Actual rules must be agreed and documented before commercial work. Define eligible introductions, cost treatment, payment timing, cancellations, taxes and approval.

This example is not a promise of earnings or a finalized contract.

37 | Quick reference: service to client

Business website | hotels, firms | no clear online information | organized web pages
E-commerce | retailers | scattered online orders | catalogue and order flow
Management system | SMEs | disconnected records | tailored business workflow
School system | schools | scattered student/admin records | organized school records
Restaurant/POS | cafes | order and sales confusion | recorded order workflow
Inventory/sales | shops | poor stock visibility | stock movement and sales records
Booking | salons/clinics | appointment conflicts | booking and schedule workflow
Mobile app | service platforms | phone user journey needs app | client/staff app review
Desktop app | counters/offices | focused computer workflow | desktop tool assessment
Backend/API | app/platform teams | shared data/communication need | server-side service
Integration | multi-tool firms | duplicate entry | agreed system connections
Hosting/maintenance | site owners | upkeep unclear | planned hosting and support
IT consultancy | unsure client | unclear technology choice | review and recommendations
Cybersecurity | connected organizations | access/backup weakness | defensive review
Automation | repetitive teams | manual repeated steps | mapped automated workflow
Custom solutions | specific operations | standard tools do not fit | scoped assessment

37 | Quick reference: problem to possible solution

Manual sales records > Sales Management System
Poor stock visibility > Inventory System
No online presence > Business Website
Manual appointments > Booking System
Scattered school records > School Management System
Online selling difficulties > E-commerce
Different systems do not communicate > System Integration
Repeated manual tasks > Business Process Automation
Weak website maintenance > Hosting & Maintenance
Unclear technology choice > IT Consultancy
Weak access or backup practices > Cybersecurity review

These are starting points for discovery, not automatic diagnoses. Ask questions and let technical staff confirm the suitable service.

38 | Final sales playbook

1 Find the right business. 2 Research it. 3 Start a professional conversation.
4 Ask questions. 5 Identify the problem. 6 Match it to a possible JAYTRIX service.
7 Explain business value. 8 Qualify the opportunity. 9 Involve technical staff.
10 Follow up. 11 Support the proposal process. 12 Help convert the opportunity into a project. 13 Maintain the relationship.

You do not need to be a programmer to create technology opportunities.
Your job is to understand businesses, identify problems, communicate clearly, build trust and connect the right client with the right JAYTRIX solution.

The technical team builds the solution.
You help us find the opportunity.
